

```
~/acme-kit $ acme --version
```

Acme Kit

2.1.0 ■

Build every report from one command, in whatever format the reader asked for.

THE GAP

Six scripts, four formats, one deadline.

```
$ ls scripts/  
build.sh  build-slides.sh  build-print.sh  
render.sh  render-old.sh  FINAL-render.sh
```

They drift. The one that matters is always the one nobody ran. A build is a fact about a project, not a habit of the person who last shipped it.

HOW IT WORKS

One command, every target.

Declare the targets once. Acme Kit reads them, builds only what changed, and writes each one where it belongs.

```
targets:
  report: {format: pdf,  profile: release}
  slides: {format: html, profile: talk}
  archive: {format: docx, profile: release}
```

```
~/acme-kit $ acme build --profile release ■
```

WHERE IT PAYS OFF

Three places it earns its keep.

monthly

The same command in the same order, so the December build is the January build.

one-source

Two targets, one set of numbers. The slides cannot fall behind the manuscript.

handover

The build is in the repository, not in the head of whoever set it up.

IN 2.1.0

What changed.

+ profiles	one target set, several build shapes
+ incremental	rebuild only what moved
! paths	now resolve from the project root everywhere

Upgrading is a version bump. Existing target files keep working unchanged.

GET IT

Install and build.

```
brew install acme-kit  
acme init
```
